

- 1) Brief overview of the project and the list of features:

The project I am creating is a CRM system for a small company. It allows an easy management of potential and existing customers by a Sales person and Account managers.
- 2) User interface design:

The user interface is provided above. Basically, a user of the system will have access to different information about customers. There are some interactive graphics and charts.
- 3) Application flow and navigation structure:

I am aiming for a single page feel and look. The right hand side contains a fixed menu bar. The main content will be shown in the central part of the page. Depending on the user choice different information will be show. The user will be able to filter the information contained in the tables. The structure of the menu is provided below.
- 4) Suitable sources.

I have used a Balsamic Mockups software <https://balsamiq.com/products/mockups/>
For the user interface i will use Bootstrap <http://getbootstrap.com/>

Menu Structure
